Computer Graphics Project Proposal

Project Name

Echoes of the Forgotten

Part 1: Project Overview

Project Summary

Echoes of the Forgotten is a small 3D platformer where the player explores three different levels while uncovering a simple story. The player will move through abandoned ruins, underground caves, and an ancient temple while completing platforming challenges. Each level will have a different environment and visual style while still keeping the game visually consistent.

The main goal of the project is to create a fun and simple 3D platformer while demonstrating computer graphics techniques learned throughout the course. The project will focus on creating 3D environments, lighting, materials, animation, and camera movement. The game will use a stylized low-poly art style so that the project remains achievable within the semester.

Project Objectives

- Create a playable 3D platformer.
- Create three small levels with different environments.
- Use computer graphics techniques such as 3D models, lighting, materials, and animation.
- Create a simple story that connects the three levels.
- Produce a polished and playable final project.

Part 2: Technical Scope

The main graphics features I plan to use are:

3D Models

3D models will be used for the player, platforms, buildings, and environment. This will create the main game world.

Materials and Textures

Different materials and textures will be used for objects such as stone, grass, dirt, and wood. This will make the environments more visually interesting.

Lighting

Lighting will be used to create different moods for each level. For example, the first level can be bright while the cave level can be darker.

Camera

A third-person camera will follow the player and allow the player to clearly see the platforms and environment.

Animation

Basic animations will be used for the player and some environmental objects to make the game feel more alive.

Visual Effects

Simple particle or environmental effects may be added, such as dust, smoke, or other effects, to improve the atmosphere.

Part 3: Visual Design Plan

The game will use a **stylized low-poly fantasy** art style.

The first level will be an **overgrown ancient ruin**, using stone, grass, and trees.

The second level will be a **dark underground cave**, using rocks, darker lighting, and atmospheric effects.

The third level will be an **ancient temple**, using large stone structures and more dramatic lighting.

The low-poly style will keep the project manageable while still allowing us to create interesting and visually different environments.

Part 4: Development Plan

Responsibilities

Tyler Spurell

- Player movement
- Camera
- Gameplay
- Level progression
- 3D environments
- Level design
- Materials and textures
- Lighting
- Animation
- Visual effects

My group member dropped the course that work load looks fun

Development Plan

1. Create the basic player and movement.
2. Create a simple test level.
3. Add graphics features such as models, materials, and lighting.
4. Build the three levels.
5. Add the story and visual effects.
6. Test and polish the final game.

Possible Risks

The main risks are the project becoming too large and not having enough time to finish everything. To prevent this, the game will only contain **three small levels** and simple platforming mechanics. Extra features will only be added if the main project is finished.
